

STATIC SET-UP ($V = \text{const}$)

- $F = K d$, K and d are known. $\Rightarrow F$ known.

By backpropagation is easy to get K_e .

$$K_e = \frac{K d}{I} \frac{D}{4}$$

- Final value theorem $s \rightarrow 0$.

$$I(0) = \frac{1}{2R} V(0) \Rightarrow R = \frac{1}{2} \frac{V}{I}$$

DYNAMIC SETUP

$V = \text{TRAIN OF PULSES}$.

V^* so that we don't overshoot the available travel.

SAVE CURRENT AND VOLTAGE.
